# Checkpoint blockade inhibition as an anti-cancer strategy

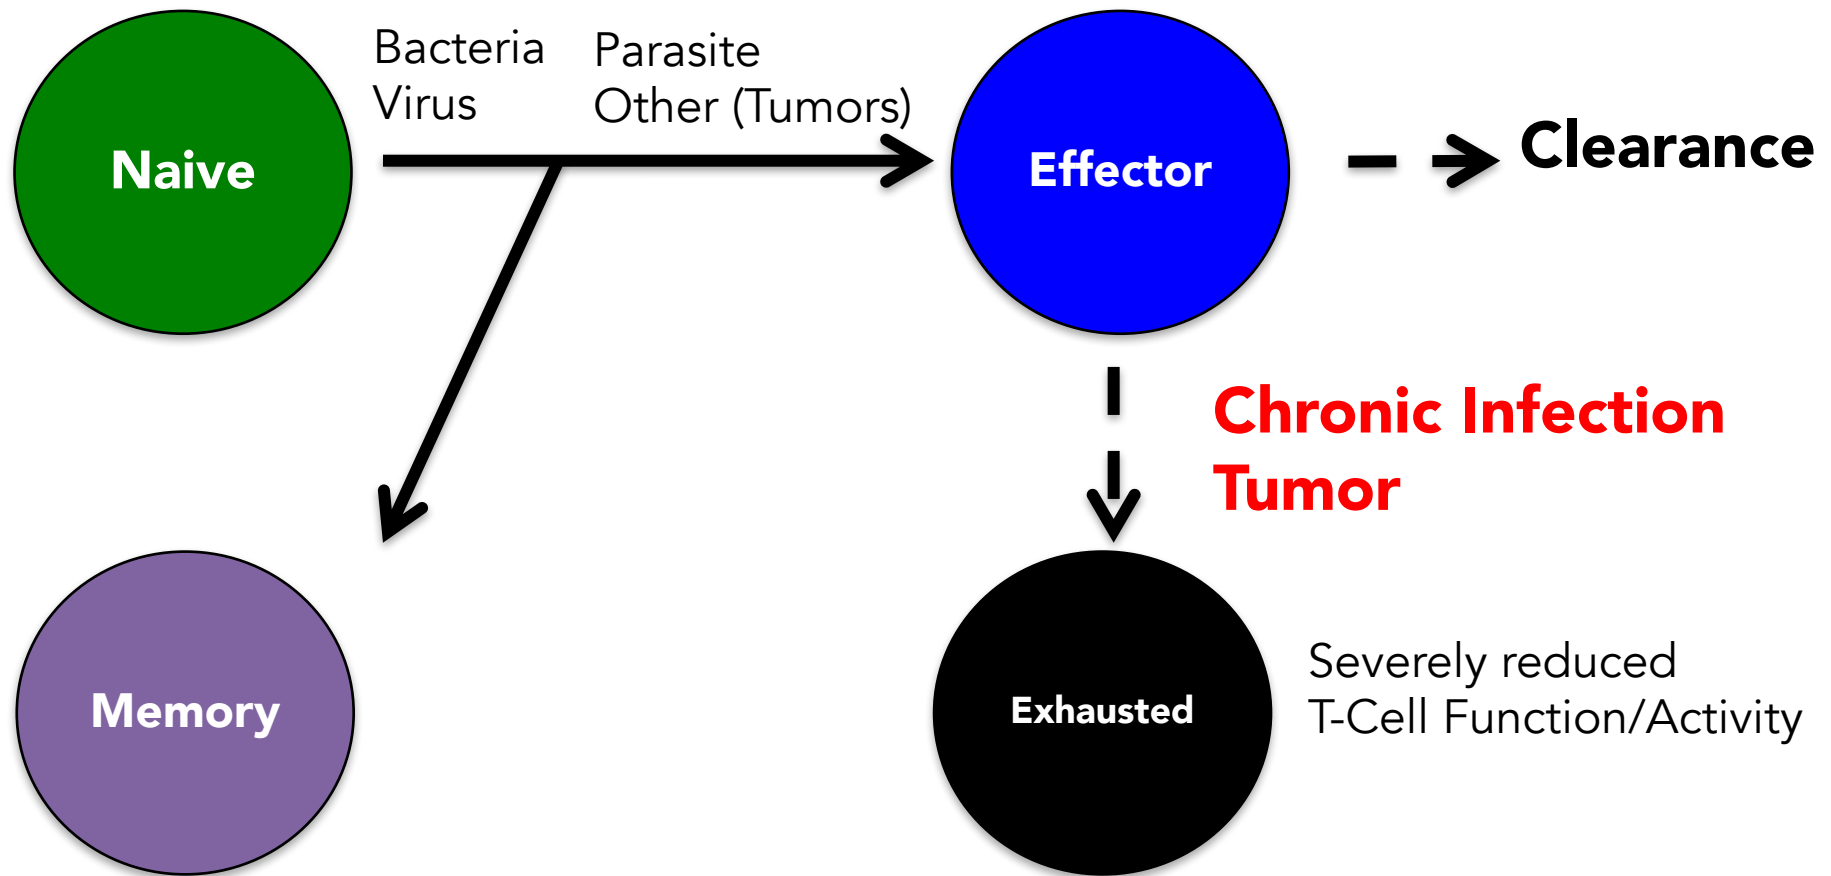

Drugs targeting PD1 and/or PD-L1 have shown efficacy in melanoma (and other cancers)

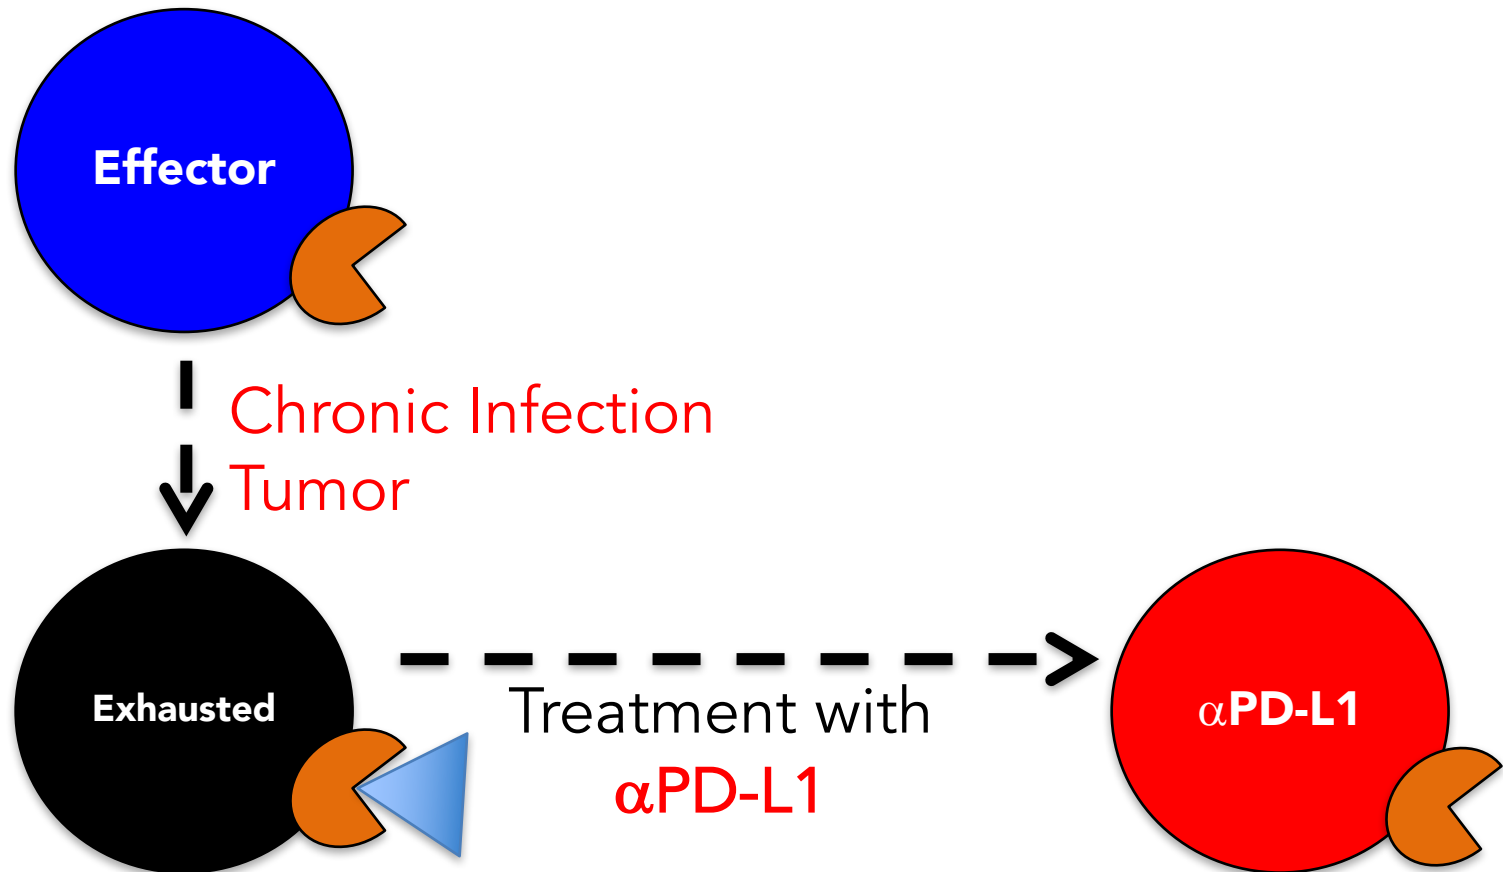

# Genomics of T cell exhaustion (and reinvigoration)

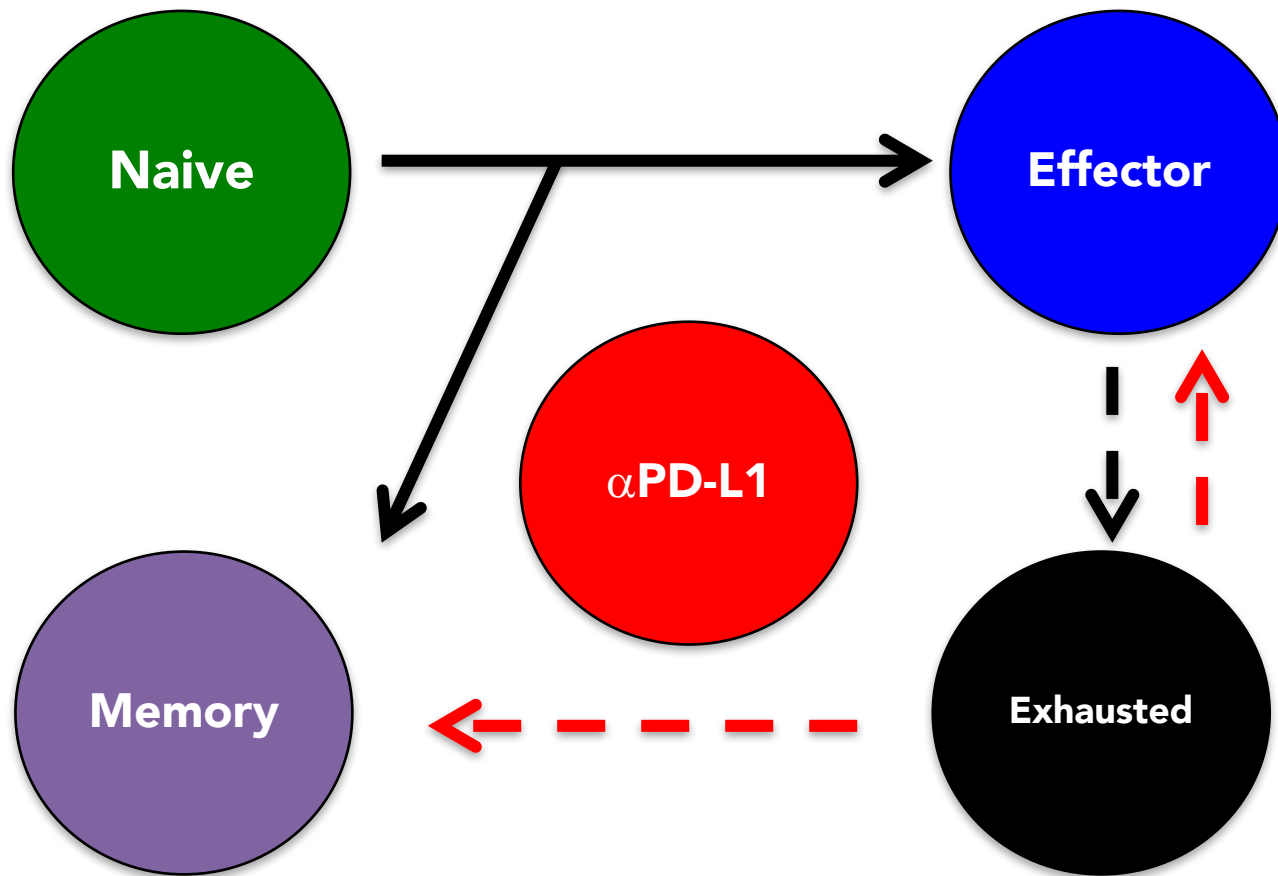

# Genomics of T cell exhaustion (and reinvigoration)

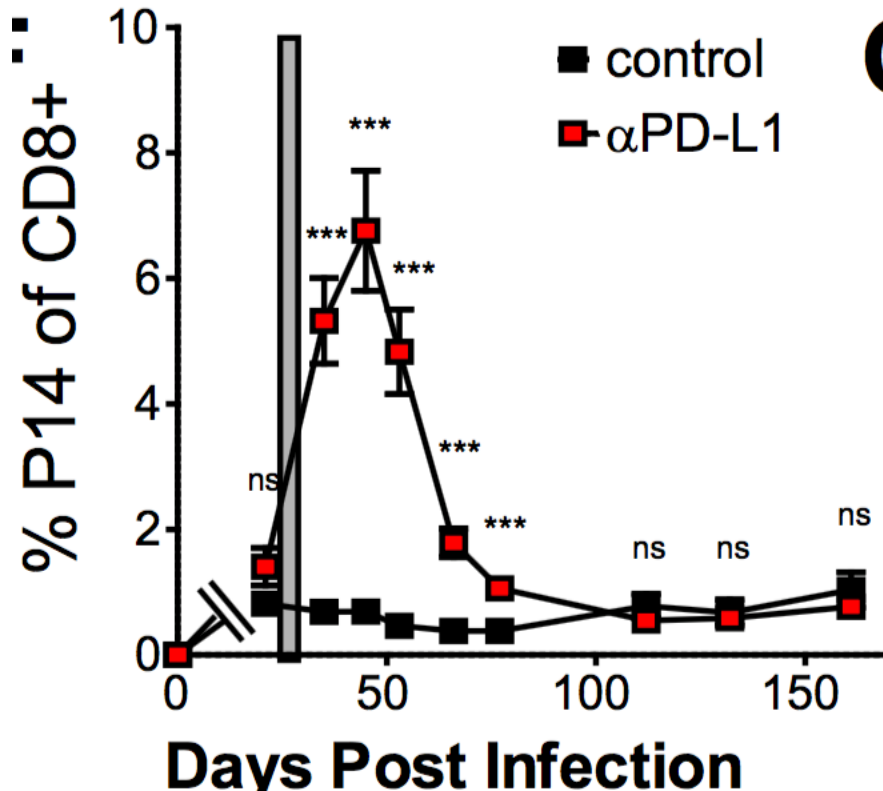

# Genomics of T cell exhaustion (and reinvigoration)

Where do exhausted and  $\alpha$ PD-L1 cells fit?

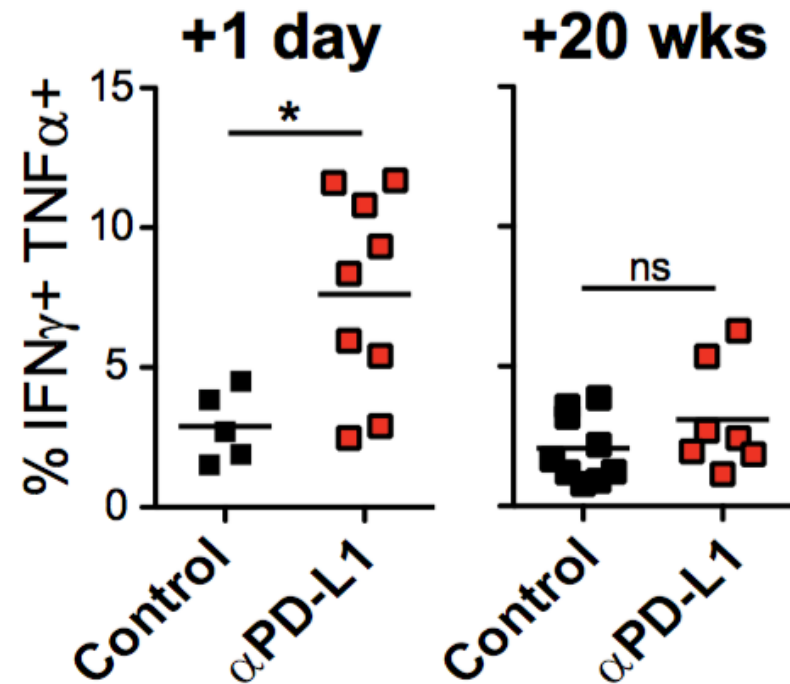

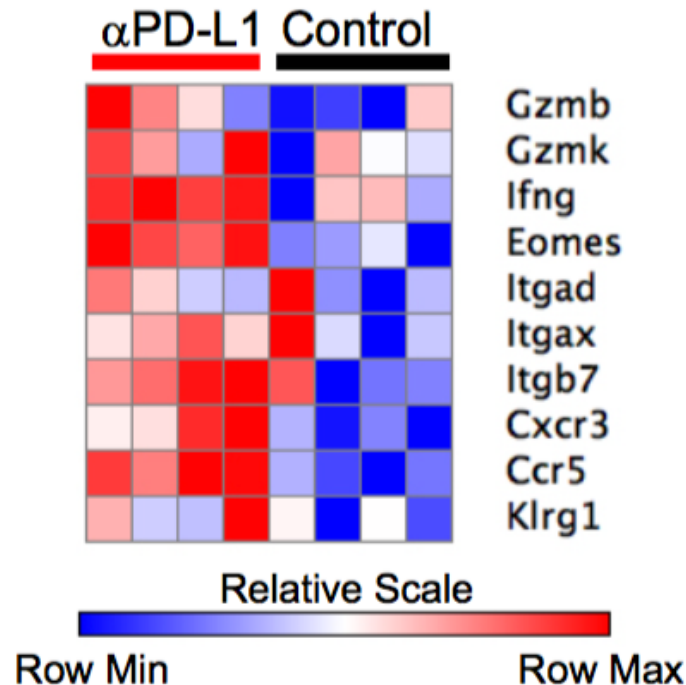

# Experimental paradigm

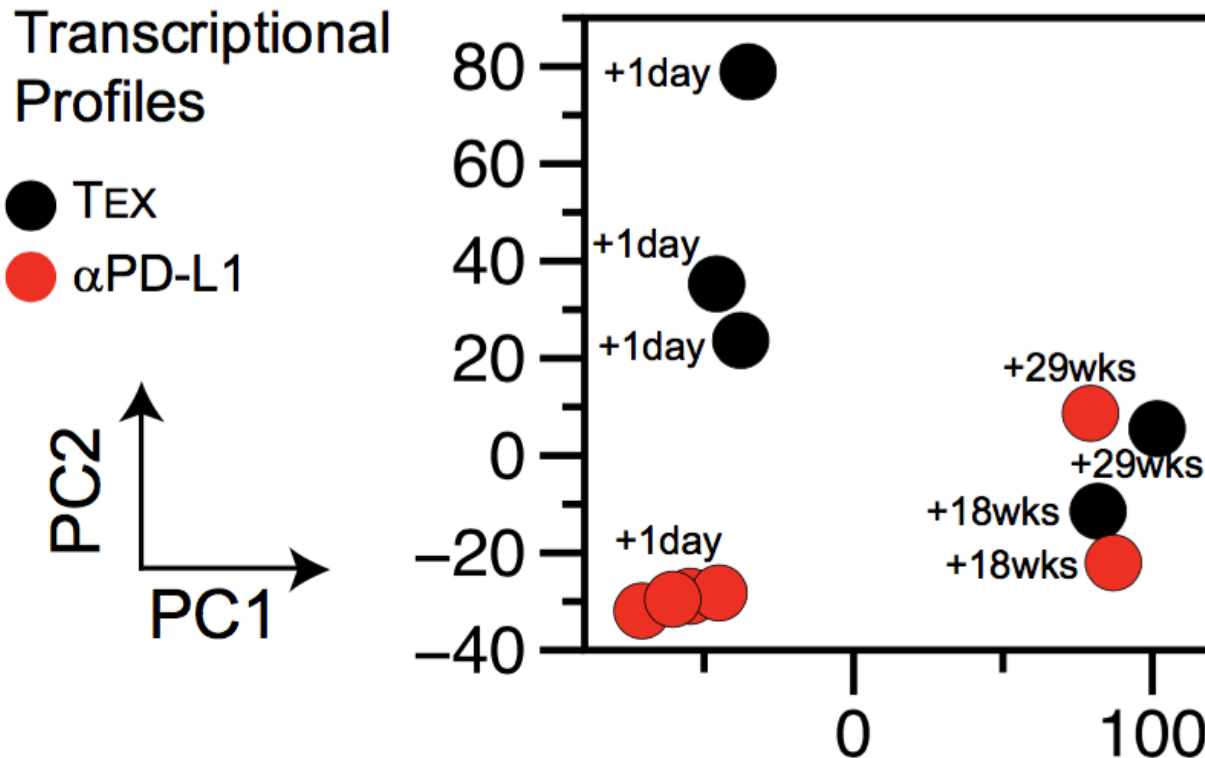

1. Mice infected with chronic viral infection
2. T-cells allowed to exhaust
3. αPD-L1 is added for 1 day
4. Effector/cytotoxic T cell function is monitored for a really long time...

# $\alpha$ PD-L1 treatment makes exhausted T-cells more “effector-like”

## ) Effector genes

# Exhausted T-cells treated with $\alpha$ PD-L1 rapidly remodel their transcriptome ...temporarily

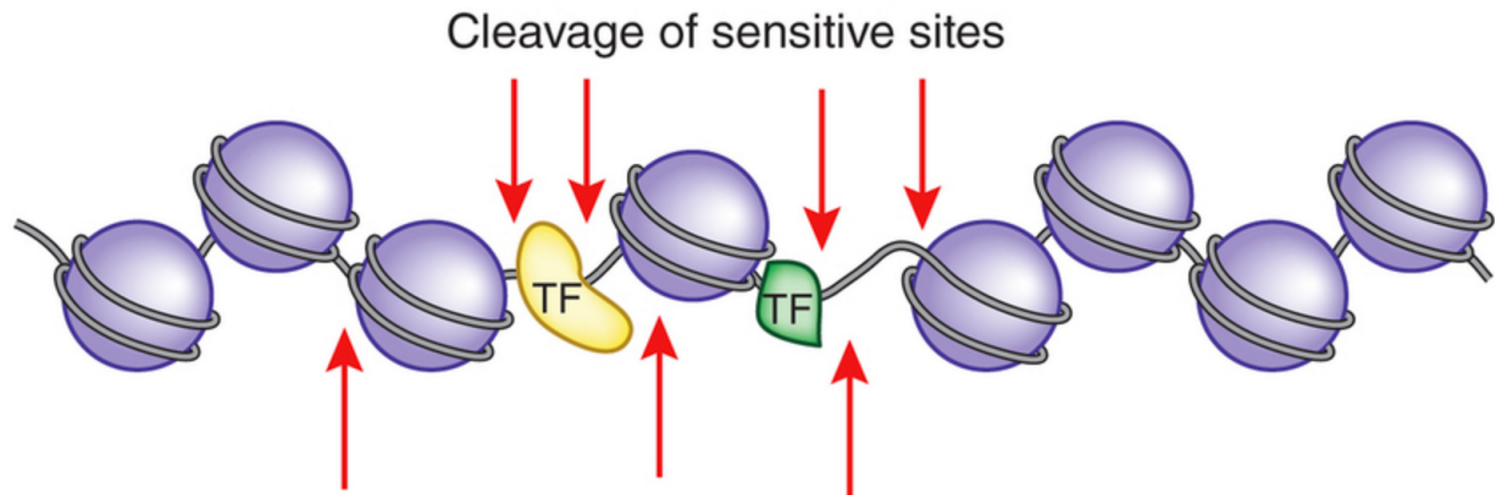

Each sample above was from N=3 mice yielding 10,000 total cells/per condition

# Using ATAC-seq to assess lineage specific chromatin states in T cells

Tn5 transposase on intact nuclei

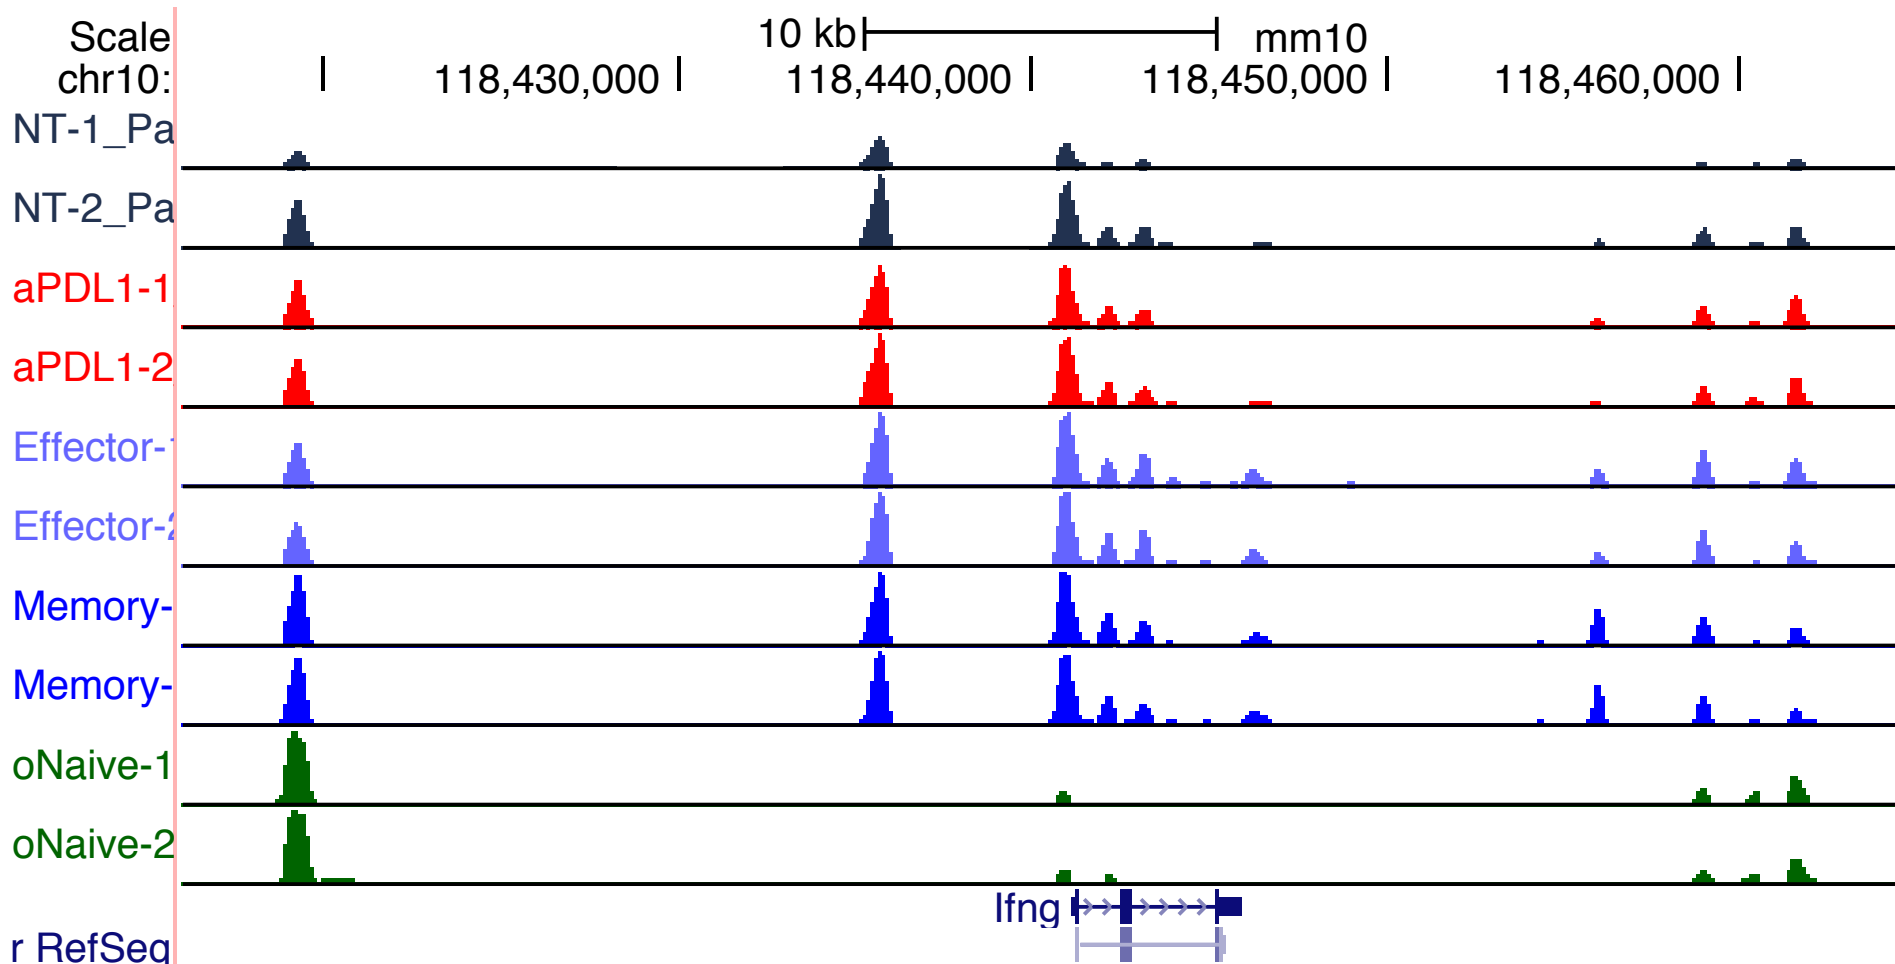

(Illumina Nextera)

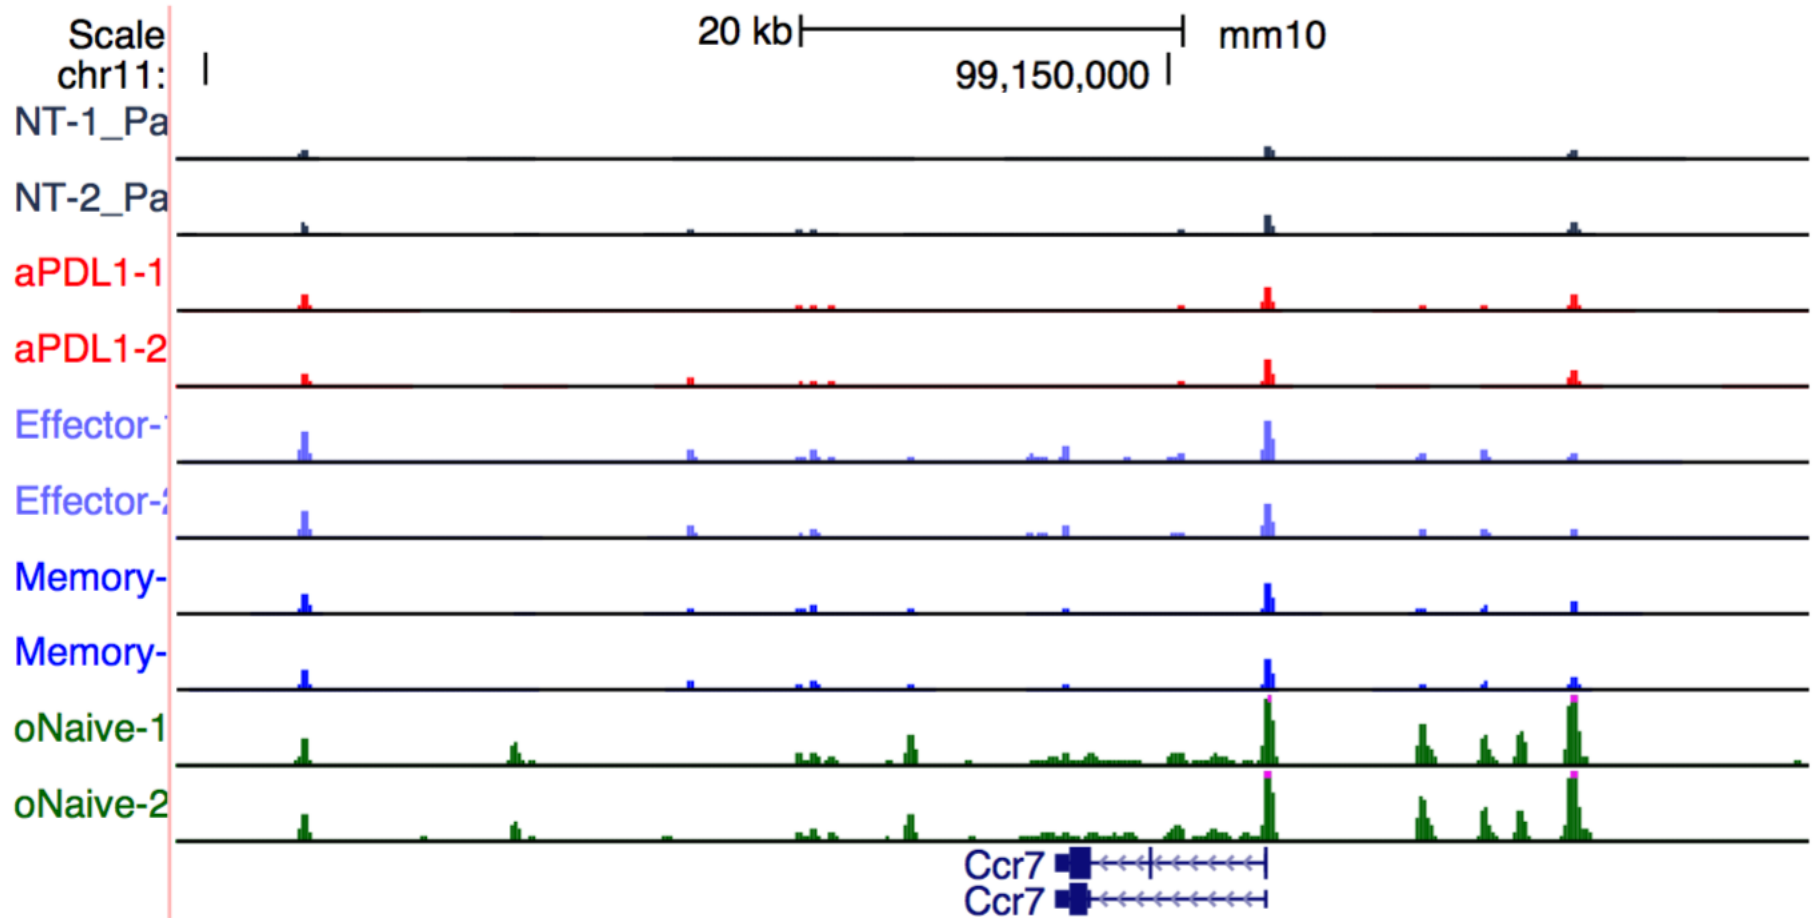

Map regulatory regions and  
assess lineage-specific patterns

N=10 pooled mice per replicate, 2 biological replicates for  
5 T-cell populations

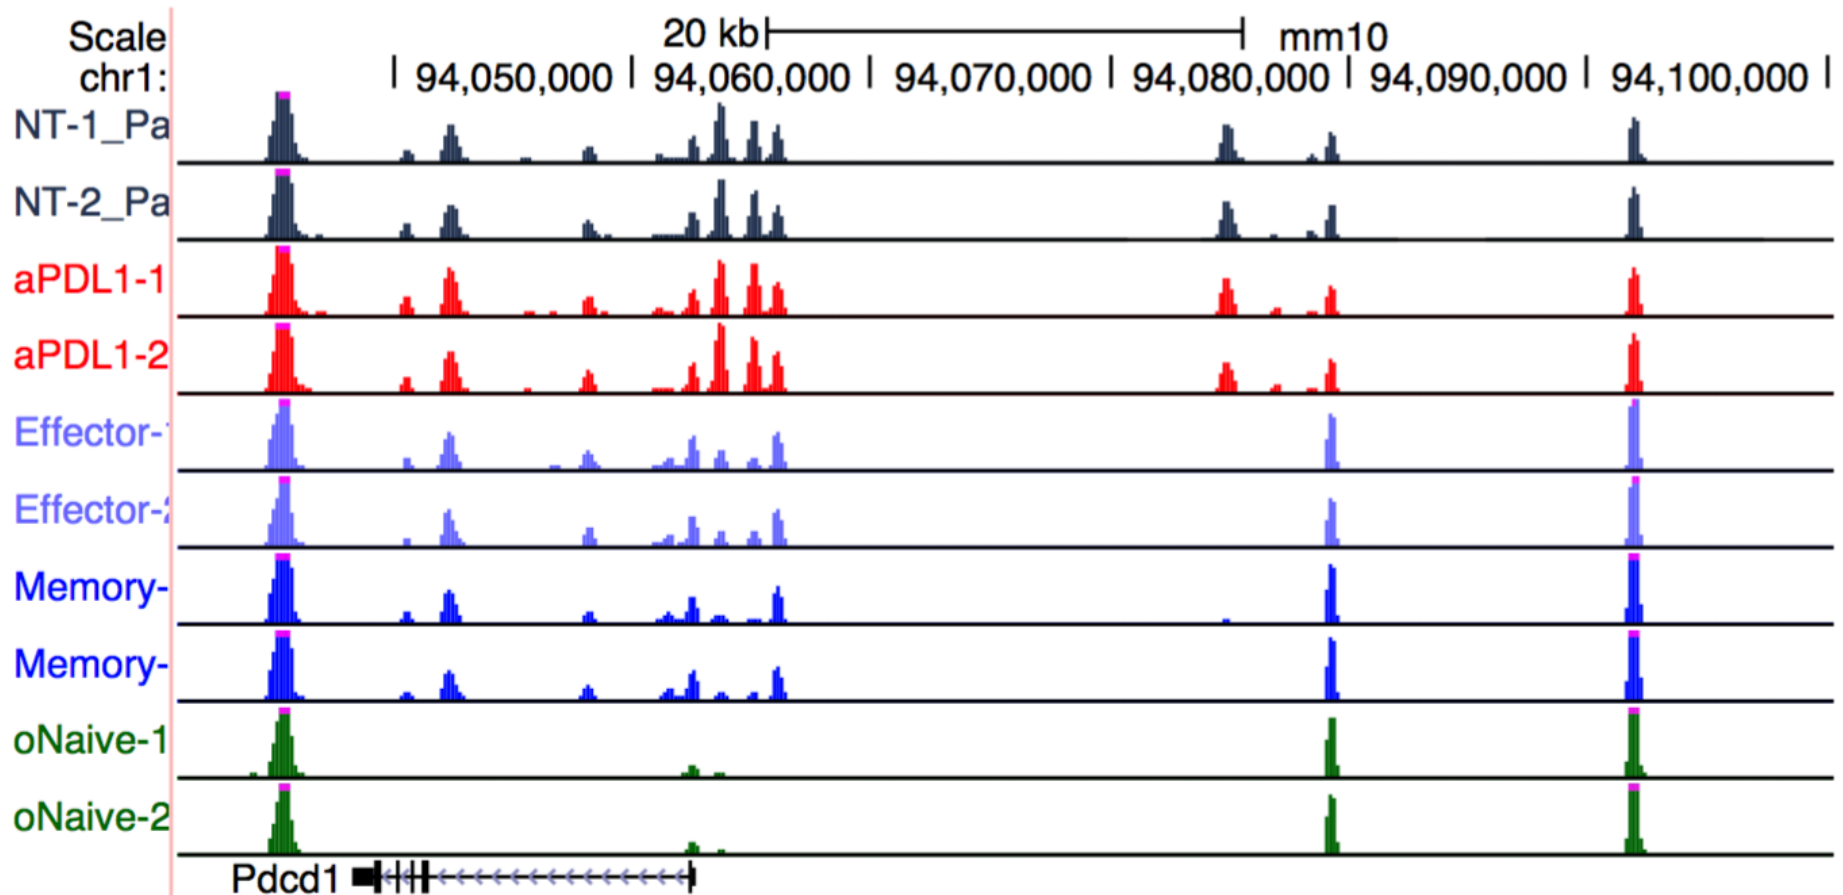

# Activated T-cell specific pattern

# Naïve-specific patterns

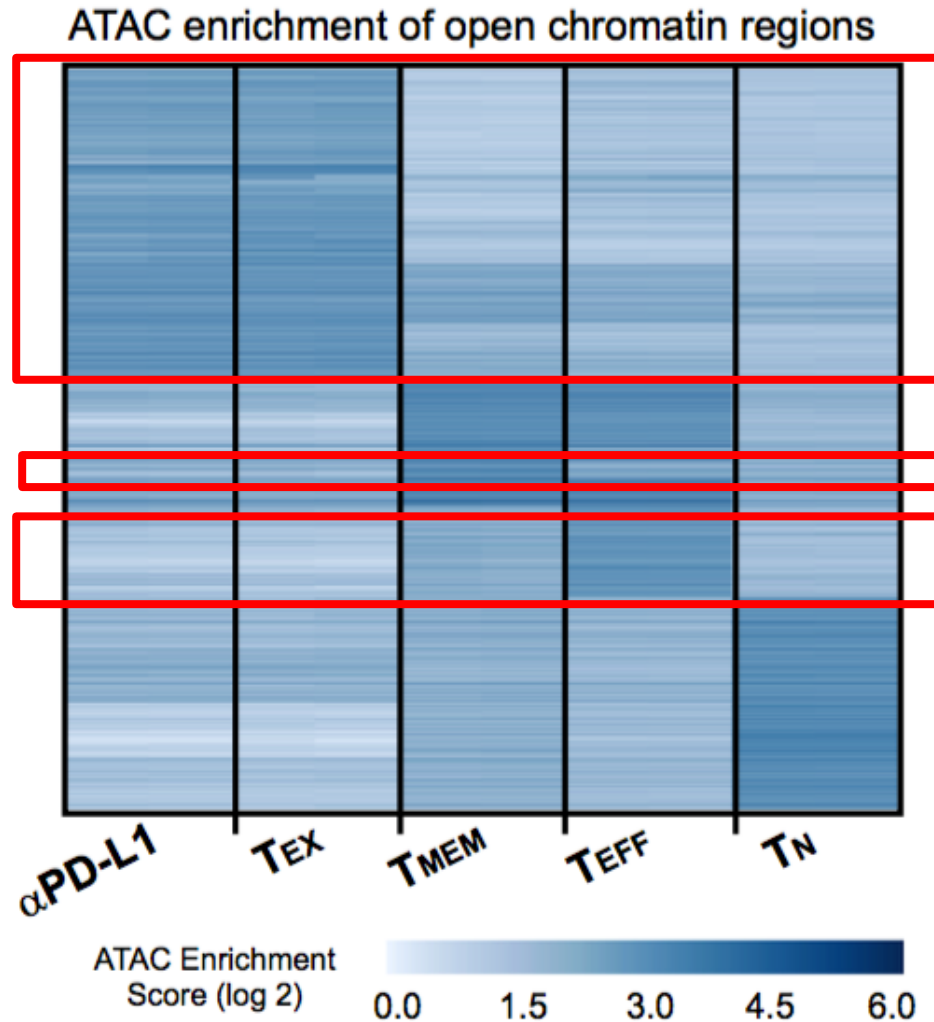

# Exhausted T-cell specific pattern

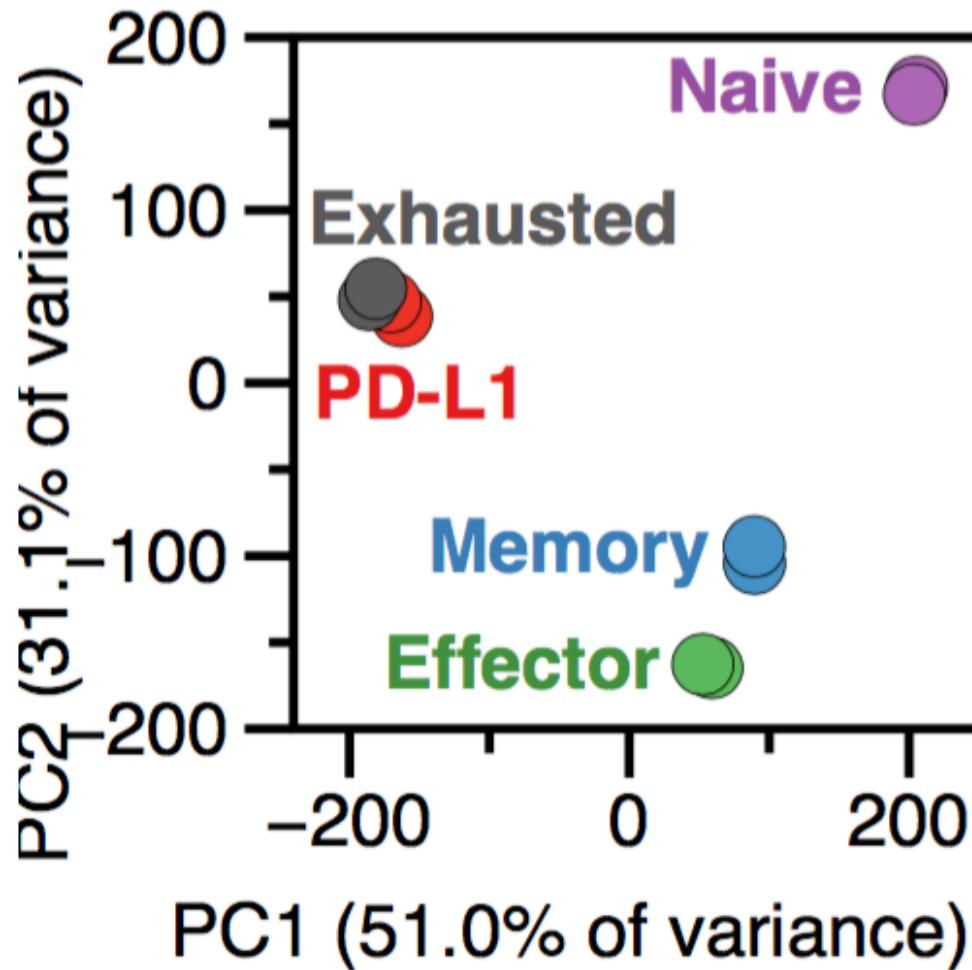

This new enhancer region is critical for transcriptional upregulation of PD-1 seen in exhausted T-cells. (companion paper from Haining Lab, Dana Farber)

# Exhausted T-cells are highly dissimilar from $T_{\text{mem}}$ , $T_{\text{eff}}$ , or $T_{\text{naive}}$ cells

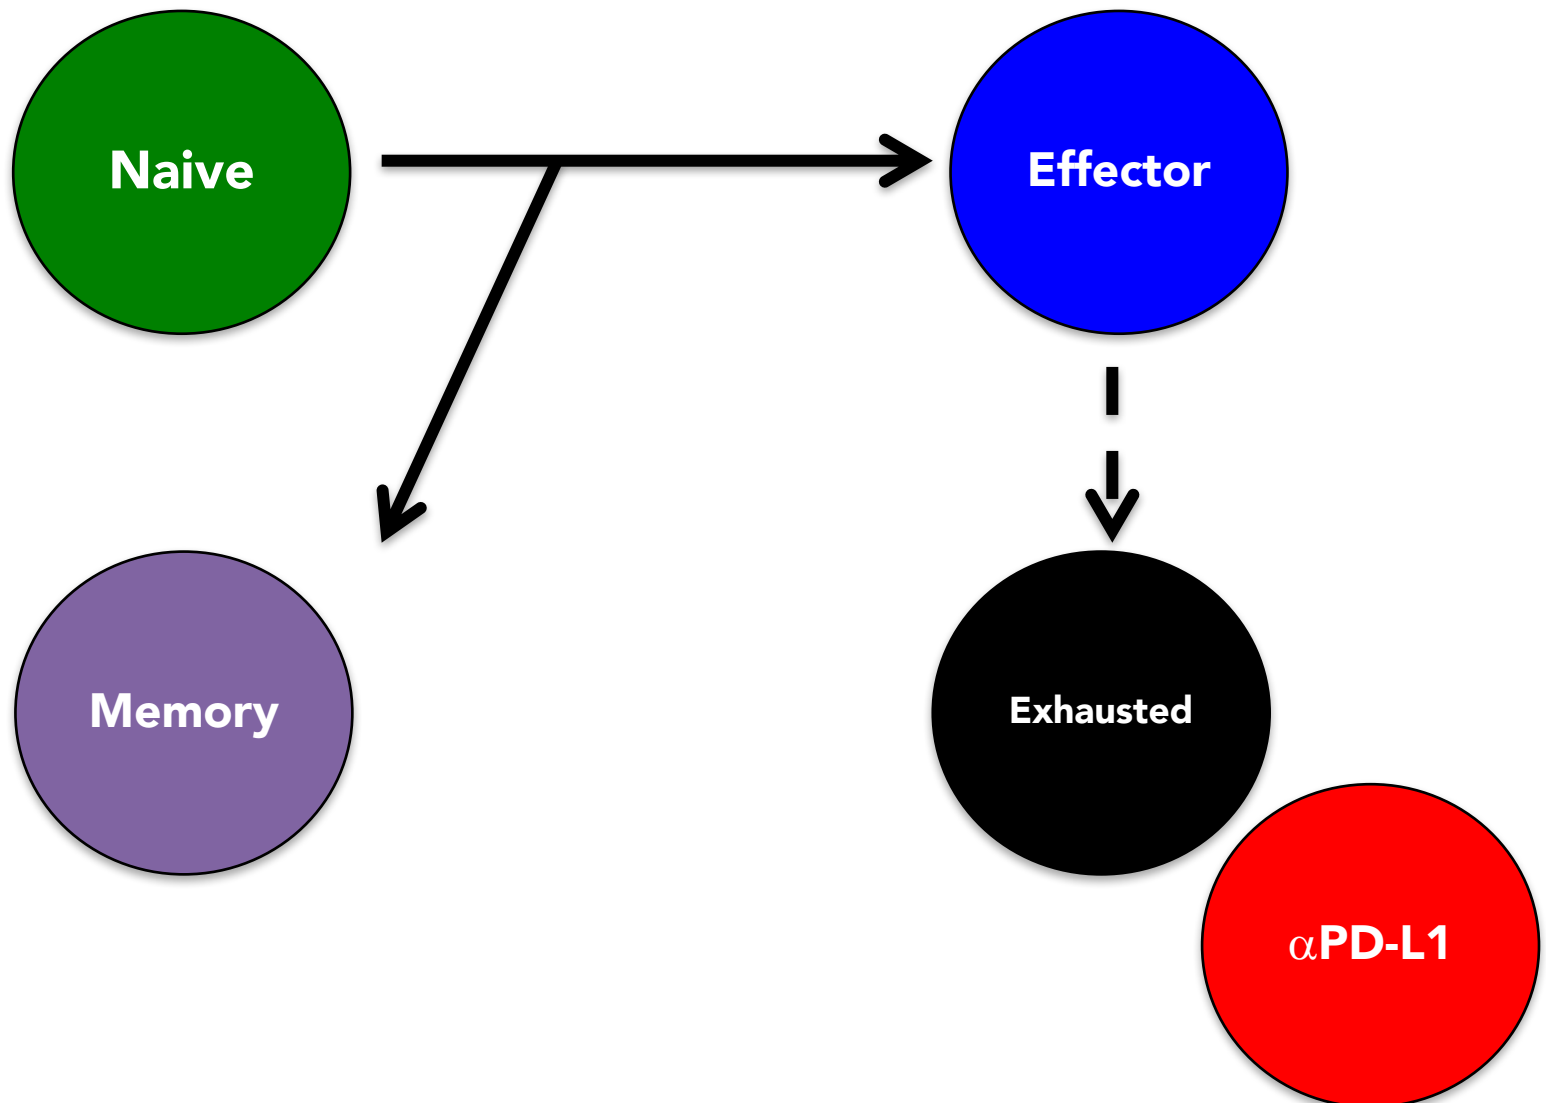

But similar to  $\alpha$ PD-L1 treated cells...

# Exhausted T cells are a distinct lineage

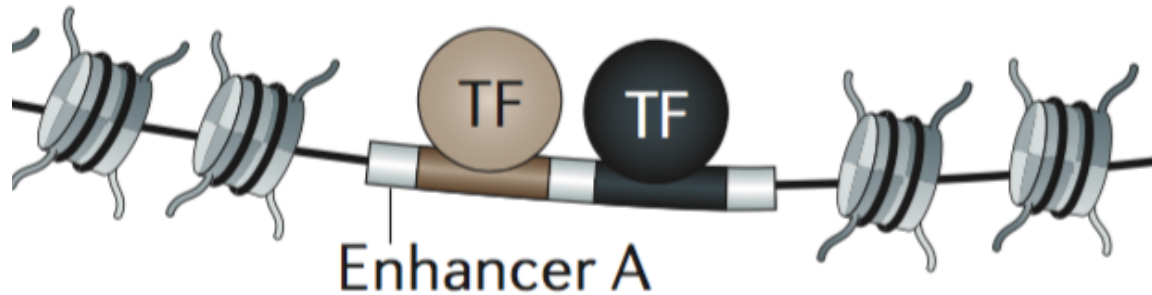

$\alpha$ PDL-1 treatment does not lead to differentiation

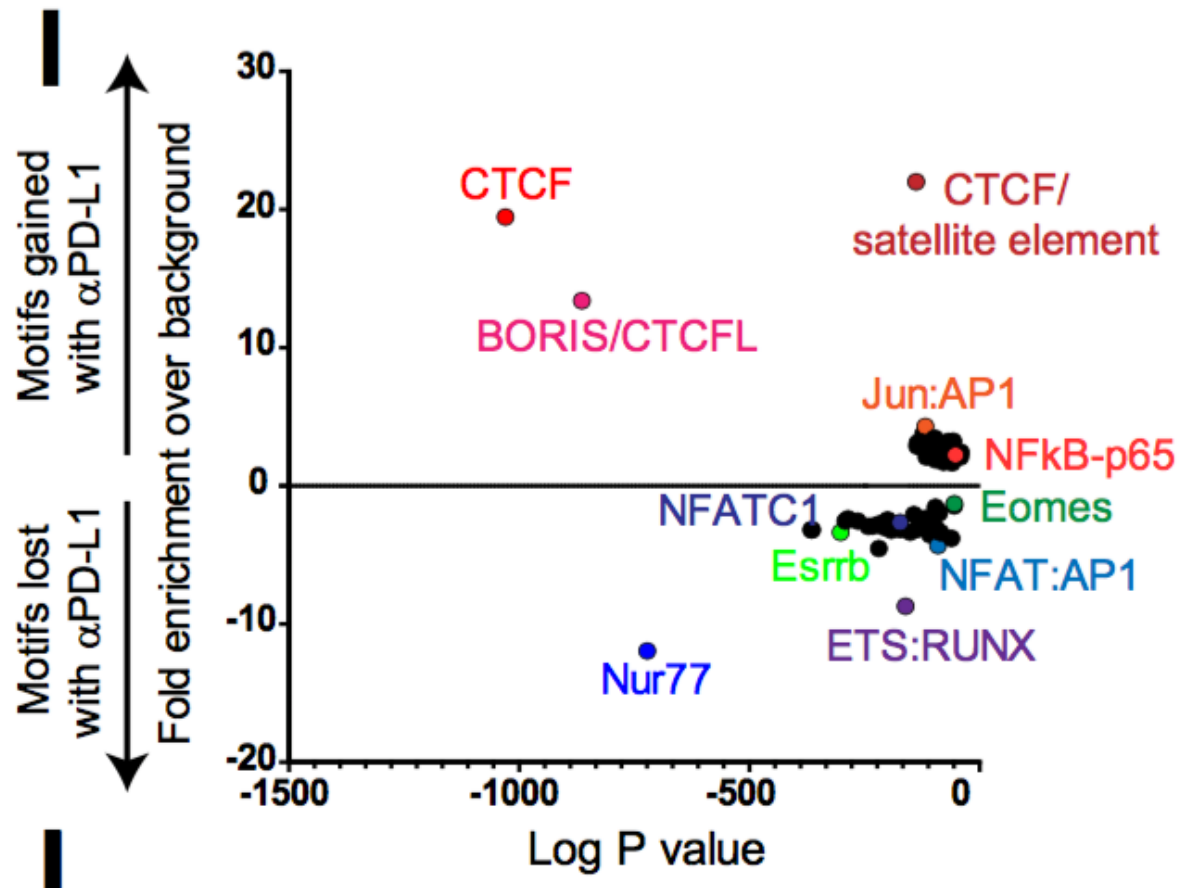

Where do exhausted and  $\alpha$ PDL-1 cells fit?

# Identifying (putative) transcription factor binding sites from ATAC-seq data

Nur77/NR4A1 motif-containing peaks are downregulated after  $\alpha$ PDL-1 treatment

Nur77/NR4A1 is a pro-apoptotic TF in T cells

Pauken, **Sammons**, et al *Science* : November 2016

# Summary of T cell exhaustion and reinvigoration with $\alpha$ PD-L1

- Exhausted T cells treated with  $\alpha$ PD-L1 rapidly (and reversibly) convert to a “more effector T cell-like transcriptome state”
- This conversion is reversible, likely due to the lack of true epigenetic or sustained signaling changes.
- $\alpha$ PD-L1 treated cells do not appear to undergo a lineage transition (to  $T_{\text{mem}}$  or  $T_{\text{eff}}$  or naive)
- $\alpha$ PD-L1 treated cells appear to downregulate Nur77, a pro-apoptotic gene, ostensibly allowing them to fight on for longer.
